

JADAN

...no sweat

Verti-Stack

Reduce stacking time by up to 50%

Why a Verti-Stack?

Eliminates the need for a complete stop during pickup, operators simply slow down and use a standard big bale spear.

Boosts productivity by enabling faster, smoother workflows in large square bale operations.

Backed by field studies demonstrating significant time and cost savings.

Australian made for Australian conditions.

Efficiency, Manoeuvrability & Performance

The Jadan Verti-Stack revolutionises bale handling by reducing collection time by over 50% compared to traditional methods. This not only lowers labour and fuel costs but also minimises ground compaction.

Seamless Stacking & Handling

Neatly stacks bales one on top of the other, maintaining the traditional transport configuration. A loader operator no longer needs to stop to pick up stacks—simply slow down and use a standard big bale spear.

Compatibility & Protection

Designed for dry hay bales ranging from 185 cm to 260 cm in length. Works with all major 120 cm wide balers and is fully compatible with Gazeeka Moisture meters. Features electronic and mechanical safeguards to protect both the baler and the Verti-Stack in case of abnormal bale formation.

Optimised for Transport & Operation

Two modes: Working & Transport.

Working mode: Drawbar is retracted, castor wheels are unlocked, and the 3-point hitch ensures straight tracking for smooth bale entry.

Transport mode: 3-point hitch disengages to a single point, castor wheels lock, and the hydraulically extendable drawbar pushes the unit away from the baler for better road speed, tracking, and turning.

Switching between modes takes just 5 minutes.

Designed for Tough Conditions

Live bed with powered rollers ensures reliable bale movement, even in harsh terrain and hilly conditions.

Screen Features

The Verti-Stack features an in-cab monitor that allows the operator to track the number of bales being carried. This monitor also provides the flexibility to eject bales at any point after completing the current bale cycle.

Manual mode - to control the machine manually when ejecting broken bales.

Automatic mode - used in normal operation, collects 4 bales then unloads.

Scales/weighing platform - weighing every single bale through the machine, allowing for consistent bale weight all day long.

Bale & weight counters - with 2 session counters, know your number from paddock to season.

Hold feature - used to pause the sequence while turning corners ensuring a perfect stack every time.

Dump feature - used to unload the remainders when finished the session.

"The Verti-Stack is like an accumulator and a telehandler in one."
– Murray Junk, Narrogin Valley Farmer

Design

The Jadan Verti-Stack is engineered to stack bales one on top of the other, maintaining the traditional transport configuration.

Specifications

Capacity:	2 (4x4 or 4x3) bales 3 (4x4 or 4x3) bales 4 (4x3 only) bales
Bale Size:	1200mm wide bales
Dump:	Auto
Width:	3150mm
Length:	3660mm
Weight:	Approx. 3200 kg
Tyre Size:	400/60 x 15.5
Electrical:	12 volt battery power
Hydraulics:	40LPM @ 2500psi
Length of Bales:	185cm-260cm
Colour options:	Jadan - Red/White New Holland - Yellow/Black

The Verti-Stack is supplied with a towbar to match the baler.
