

# Teltek LS-150

The TELTEK LS150 takes products delivered in groups across the feeder and delivers a uniform line to downstream systems. The LS100 is designed for rollstock machines and other machines that present products in batches.

First the products are separated in length and then guided towards the centre of the belt. The side guides minimize the risk of turning the product, which simplifies the task for downstream machines.

The TELTEK LS150 comes with a stainless steel stand and electronics cabinet, and aluminium conveyors. It is controlled via a PLC system and photocells. Speed is determined by the length of the incoming feed and the number of conveyors. Depending on design, the LS150 can handle a total of up to 80 - 120 products per minute. The LS150 is CE marked and can be supplied with several, easily interchanged conveyor options.
