DGT4X

Digital weight transmitter with 4 channels

USER MANUAL | **ENGLISH**
Firmware version 01.07.xx

Contents

Optimized layout for A4 print.

Introduction

Dear Customer,
Thank you for purchasing a DINI ARGEO product.

This manual contains all the instructions for a correct installation and commissioning of the DGT4X 4-channel digital weight transmitter.
While thanking you for purchasing this product, we would like to draw your attention to some aspects of this manual.

This booklet provides useful information for the correct operation and maintenance of the scale to which it refers;

it is therefore essential to pay the greatest attention to all those paragraphs that illustrate the simplest and safest way to operate.

It is recommended that you carefully follow the instructions for programming the weight transmitter; performing actions not indicated in this manual could compromise the proper functioning of the scale.

The utmost care has been taken in compiling this manual, but reports of any inaccuracies are always welcome.

The transmitter is covered by warranty and MUST NOT BE TAMPERED WITH BY THE USER under any circumstances.
Any attempt at repair or modification may expose the user to the danger of electric shock and voids any warranty conditions, relieving the Manufacturer from all liability.

Any problem with the product must be reported to the manufacturer or to the retailer where it was purchased.
In any case, always TURN OFF THE POWER SUPPLY before any installation or repair operation.

Installation requirements

Observe the following conditions for correct installation of the transmitter and of the load receiver:

- Flat, level support surface.
- Stability and absence of vibrations.
- Absence of aggressive dusts and vapours.
- Absence of draughts.
- Make sure that the platform is levelled or that the load cells are evenly supported.
- Moderate temperature and humidity (15°C - 30°C and 40% - 70%).
- Do not install in an environment where there is a risk of explosion.
- All transmitter connections must be made in accordance with applicable regulations in the area and environment of installation. Observe the electrical precautions listed in the section "**Electrical precautions**".
- Ensure that it is correctly earthed, see the relevant section "**Earthing of the system**".
- Do not perform welding when the load cells have already been installed.
- If necessary, use watertight sheaths and fittings to protect the load cell cables.
- Any junction boxes must be watertight.
- Anything not expressly described in this manual constitutes improper use of the equipment.

Electrical precautions

- Use a regulated mains supply within ± 10% of the rated voltage.
- The electrical protections *(fuses, etc.)* are the responsibility of the installer.
- Observe the recommended minimum distances between cables of different categories **(see table on page 10)**.
- The following cables must comply with the maximum permissible lengths **(see table on page 10)**, they must be shielded and must be inserted alone in metal conduits or pipes:
  - the load cell extension cables;
  - the signal amplifier cables;
  - the cables for connecting the serial ports;
  - the analog output cables.
- The cell or amplifier cables must have an independent input in the electrical panel. They must be connected (if possible) directly to the terminal block of the transmitter without passing through the conduit with other cables.
- Fit "RC" filters:
  - on the contactor coils;
  - on the solenoid valve coils;
  - on all devices that produce electrical interference.
- If condensation can occur inside the weight transmitter, it is advisable to keep the equipment powered at all times.
- Connections to load cells and any external device must be as short as possible.
- The cable ends (connectors, leads, terminals, etc.) must be installed correctly; the cable shielding must be kept intact until close to the connection point.
- If the transmitter is placed inside an electrical panel, a shielded cable must also be used for the power supply.

Optimized layout for A4 print

RECOMMENDED DISTANCES AND CABLE CLASSIFICATION

	Category I	Category II	Category III	Category IV
Distance	≥ 100 mm ≥ 200 mm ≥ 500 mm	≥ 100 mm ≥ 500 mm	≥ 500 mm	
Classification	Fieldbus, LAN network (PROFIBUS, Ethernet, Devicenet...). Shielded data cables (RS232...). Shielded cables for analog digital signals < 25 V (sensors, load cells...). Low voltage power supply cables (< 60 V). Coaxial cables.	DC supply cables with voltage > 60 V and < 400 V. AC supply cables with voltage > 25 V and < 400 V.	Power supply cables with voltage > 400 V. Telephone cables.	Any cable subject to lightning danger.

MAXIMUM ALLOWED LENGTHS

Load cell	RS232	RS485	Analog output
50 metres with 6 x 0.25 mm² cable; 100 metres with 6 x 0.5 mm² cable.	15 m with baud rate up to 19200.	1200 m with shielded 2 x 24 AWG twisted pair with outer braid + aluminium strip.	**CURRENT**: 100 metres with 2 x 0.25 mm² cable; 150 metres with 2 x 0.5 mm² cable; 300 metres with 2 x 1 mm² cable. **VOLTAGE**: 50 metres with 2 x 0.25 mm² cable; 75 metres with 2 x 0.5 mm² cable; 150 metres with 2 x 1 mm² cable.

Optimized layout for A4 print.

Earthing of the system

For correct earthing and optimal system operation, the transmitter, load cells, junction box, if any, and weighing structure must be earthed.

TRANSMITTER
The earth connection must be made via the appropriate terminal. The cable cross-section must be less than 2.5 mm^2.

LOAD CELLS AND JUNCTION BOX
The connection must be made by connecting the earth cables to the earth bar (cables that must have a cross-section of at least 16 mm^2); finally, connect the earth bar to the earth post with a cable having a cross-section of at least 50 mm^2.

EXAMPLES:

- If the load cells are connected to the transmitter through a junction box, the cable shield from the transmitter and the cell cable shields must be connected to the earth socket of the junction box (refer to the junction box manual) and the junction box must be earthed using a copper cable with a cross-section of not less than 16 mm^2.
- If the load cells are connected directly to the transmitter (without using the junction box), the cell cable shields must be connected to the earthing point (or earth bar).
- If the weighing system involves large and/or outdoor structures (weighbridges, silos, etc.) and the distance between the junction box and the weight transmitter is greater than 10 m, connect the cell cable shields to the earth socket in the junction box.

WEIGHING STRUCTURE
Earth the weighing structure and/or any unconnected structures (e.g. silos that release material onto the weighing structure) using cables with a cross-section of not less than 16 mm^2.
Also connect the upper part with the lower part of each cell by means of a copper braid with a cross-section not less than 16 mm^2 *(refer to the* **earthing examples on page 12 and page 13***)*.

SERIAL CABLES AND CONNECTED INSTRUMENTS
Connect the serial cable shield to the earthing point (or earth bar) inside the panel. To avoid any undesired effects, the earth reference of the connection cable, power supply and transmitter must be at the same potential.

i

GENERAL NOTES:

- All earth cables must be of suitable length, so as to obtain an overall resistance of the earthing system of less than 1 Ω.

- If the weighing system involves large and/or outdoor structures (weighbridges, silos, etc.):
  - the earth connection must be made by connecting the earth cables to an earth bar and the earth bar to the earth post with a cable having a cross-section of not less than 50 mm^2;
  - the thickness of the cables must be greater (50 mm^2 instead of 16 mm^2 and 100 mm^2 instead of 50 mm^2), because the voltages at stake are greater (e.g. lightning);
  - the earth post must be placed at a distance of at least 10 m from the structure.

- If the load receiver is more than 10 m from the transmitter, we recommend using the SENSE line and load cells equipped with a (SENSE) compensation circuit.

Technical features

POWER SUPPLY	12 - 24 Vdc LPS or with class 2 power supply.
MAXIMUM ABSORPTION (without load cells)	DGT4X: 4 W DGT4XAN: 4.5 W DGT4XPB: 4.5 W DGT4XETHIP, DGT4XPRONET, DGT4XETHCAT, DGT4XMODTCP: 7.5 W DGT4COPEN, DGT4DEVNET: 4.5 W
OPERATING TEMPERATURE	From -10°C to +40°C.
DISPLAY DIVISIONS	10000e, 2 x 3000e for legal weighing, expandable up to 800,000 for internal use (with a minimum cell signal of 1.6 mV/V).
CONVERSION SPEED	Up to 2600 conv. / sec with single channel. Up to 100 conv. / sec with 4 channels.
MINIMUM VOLTAGE PER DIVISION	0.3 µV *(approved transmitter)*; 0.03 µV *(non-approved transmitter)*.
COUNTING RESOLUTION	1,500,000 points (with input signal 3 mV/V).
DISPLAY	6 digits, h 14.2 mm (0.56").
SIGNALS	9 status indicator LED lights.
KEYPAD	mechanical with 5 keys.
TARE FUNCTION	Subtraction possible over the entire range.
LOAD CELL POWER SUPPLY	5 Vdc, 230 mA.
LOAD CELL CONNECTION	6 wires (CELL1) with sense, 4 wires (CELLS 2, 3, 4).
CONNECTABLE CELLS	Up to 16 350 Ω cells.
CASE	Made of plastic (self-extinguishing PPO), suitable for DIN rail mounting (EN 60715 - DIN43880) or wall mounting.
SERIAL OUTPUTS	1 half duplex RS485 bidirectional port on terminal. 1 RS232 bidirectional port on terminal; 1 PROFIBUS port on DB9 connector (DGT4XPB* version); 2 ETHERNET ports (versions DGT4XETHIP*, DGT4XMODTCP*, DGT4XETHCAT*, DGT4XPRONET*); 1 CANOPEN port on 5-pole terminal (DGT4XCANOP* version); 1 DEVICENET port on 5-pole terminal (DGT4XDEVNET* version). 1 USB port (micro USB type B) on front panel ➜ Virtual COM (Device). * *Fieldbus models are not equipped with port 232.*
OUTPUTS / INPUTS	2 photomosfet NO or NC outputs: max 60 Vdc 0.5 A max / 48 Vac 0.5A; 2 configurable inputs (bidirectional optocouplers): 12 - 48 Vdc; Input reading and output update time: 1 msec; 16-bit analog output (DGT4XAN version). Current: 0 - 20 mA / 4 - 20 mA. Voltage: 0 - 5 Vdc, 0 - 10 Vdc. The maximum applicable resistance on the current output is 300 Ω while the minimum applicable resistance on the voltage output is 1 kΩ.
LOAD CELL SENSITIVITY	Maximum sensitivity of the connectable load cells: 6 mV/V.
FIELDBUS UPDATE RATES	Up to 120 Hz.
CERTIFICATIONS	Indicated on the EC Declaration of Conformity of the product.

Load cell installation

After carrying out the instructions for the platform or load receiver, the shielded cable from the cell(s) must be properly connected to the terminal block(s) of the transmitter (from CELL1 to CELL4; see section "**Wiring diagrams**").

The transmitter has one channel (CELL1) for 6-wire connection to load cells (using the REFERENCE), while for the remaining channels (CELL2, CELL3, CELL4) only 4-wire connection is allowed.
The REFERENCE allows you to compensate for any voltage drop on the section of cable connecting the transmitter to the load receiver. It is especially useful when the distance between the transmitter and the load receiver is more than 10 metres, or in high-resolution applications.

Display and function of the keys

Symbol	Description
▼	Semi-automatic zeroing. Decreases the selected digit.
▲	Semi-automatic tare. Increases the selected digit.
▶	Activates the function. Selects the digit to be changed. Prolonged pressure allows you to select the active scale (only in MODE 2 "IND.CH").
↵	Confirms a value. Prints / Transmits data.
⊏	Reboots the transmitter.

Symbol	Description
›O‹	Gross weight on zero.
~	Unstable weight.
NET	A tare is active.
F	A special function is active.
W1 SP1	Output 1 is active.
W2 SP2	Output 2 is active.

Quick menu

The transmitter is equipped with a quick menu, through which you can program the main parameters of the scale.
To enter the quick menu, follow the procedure below:

1. Reboot the transmitter.
2. Press the ▶ key when the display shows *888888*.

For further information, refer to the transmitter Quick Start Guide.

Advanced programming menu

The advanced menu contains all the transmitter configuration parameters for the most advanced adjustments.

Access to the advanced menu and saving the changes

1. Reboot the transmitter.
2. Press the ▲ key when the display shows *888888*.

ℹ

HOW TO EXIT THE SETUP AND SAVE CHANGES

1. Press ⊏ several times, until the display shows "*SAVE?*".
2. Press ⏎ to save or ⊏ to exit without saving.

Function of the keys in the menu
▲	Previous parameter.
▼	Next parameter.
⏎	Access the parameter / confirm setting.
⊏	Exit a parameter (without saving).

FUNCTION OF THE KEYS WHEN ENTERING NUMBERS

▲	Increases the selected digit.
▼	Decreases the selected digit.
▶	Selects the next digit.
⏎	Confirms the value.
⊏	Resets the value. If pressed again, exits entering.

ℹ

In the menu description on the following pages **the ▽ symbol indicates repeated pressing of the ▼ key** until the parameter indicated is reached.

Scales - Weighing systems

Dependent channels

CALIBRATION PROCEDURE:

1. Select mode of use *dEP.Ch*.

2. Set the number of channels used (from *1* to *4*).

3. Set the calibration parameters:
      dEC i = Number of decimals.
      u.M. = Unit of measurement (*KG, G, t, Lb*).
      d iU = Minimum division.
      rAnGE 1 = Maximum range.

4. Set the cell data:
      SEn.CEL = Cell sensitivity (given by the sum of the mV/V value of each cell).
      CEL.CAP = Total capacity of the cells (given by the sum of the capacities of each cell).

5. Enter the weight value of the structure in the *dEAd.Ld* parameter. If you do not know this value, enter "0".

6. If the structure contains a quantity of material whose weight value is known (e.g. full silo), enter this value in the *Kno.WGt* parameter.

7. Application of theoretical calibration:
Press the **C** key to exit the calibration menu. The display shows *th.CALP*. Press the ↵ key to confirm the use of the theoretical calibration, or the **C** key to cancel.

Independent channels
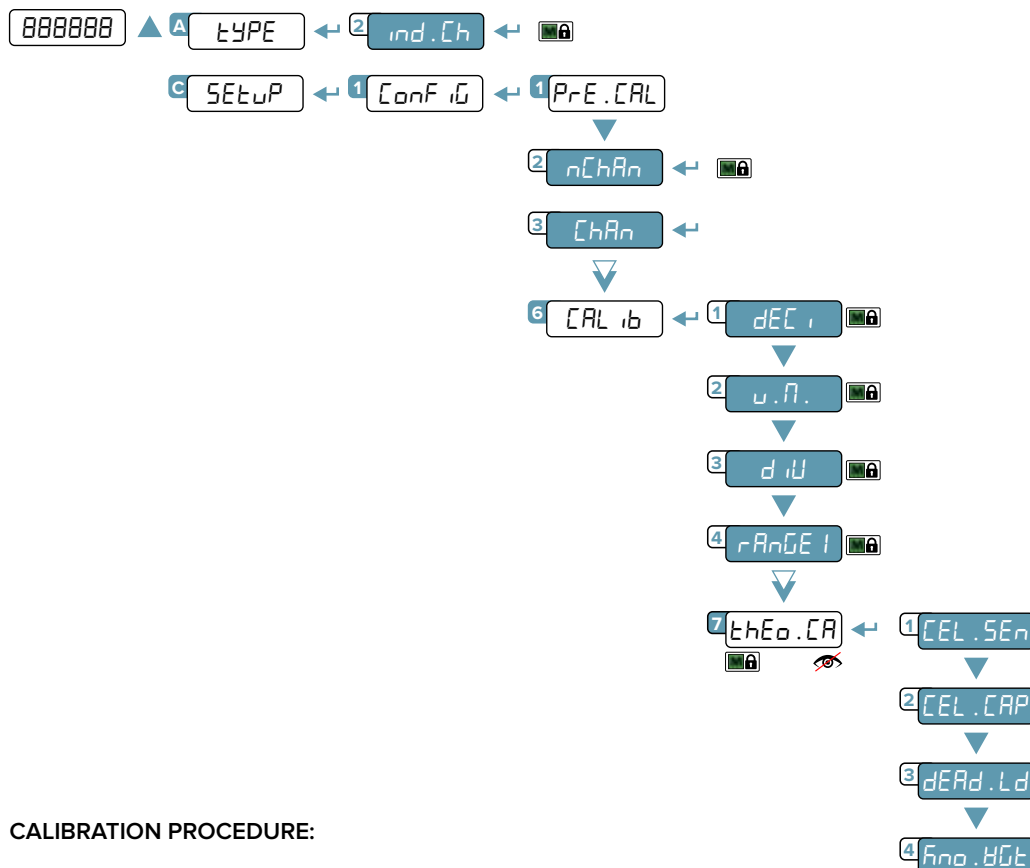

CALIBRATION PROCEDURE:

1. Select mode of use ınd.Ch.

2. Set the number of connected scales (from 1 to 4).

3. Select the scale to be calibrated (from 1 to 4).

4. Set the calibration parameters:
- dEC ı   = Number of decimals.
- u.M.   = Unit of measurement (KG, G, t, Lb).
- d ıU   = Minimum division.
- rAnGE 1   = Maximum range.

5. Set the cell data:
- SEn.CEL = Cell sensitivity (given by the sum of the value of each cell).
- CEL.CAP = Total capacity of the cells (given by the sum of the value of each cell).

6. Enter the weight value of the structure in the dEAd.Ld parameter. If you do not know this value, enter "0".

7. If the structure contains a quantity of material whose weight value is known (e.g. full silo), enter this value in the Fno.WGt parameter.

8. Application of theoretical calibration:
Press the ⊏ key to exit the calibration menu. The display shows th.CALP. Press the ↵ key to confirm the use of the theoretical calibration, or the ⊏ key to cancel.

9. Repeat the procedure from point **3** for each scale to be calibrated.

*Complete menu on pages **24 - 25***
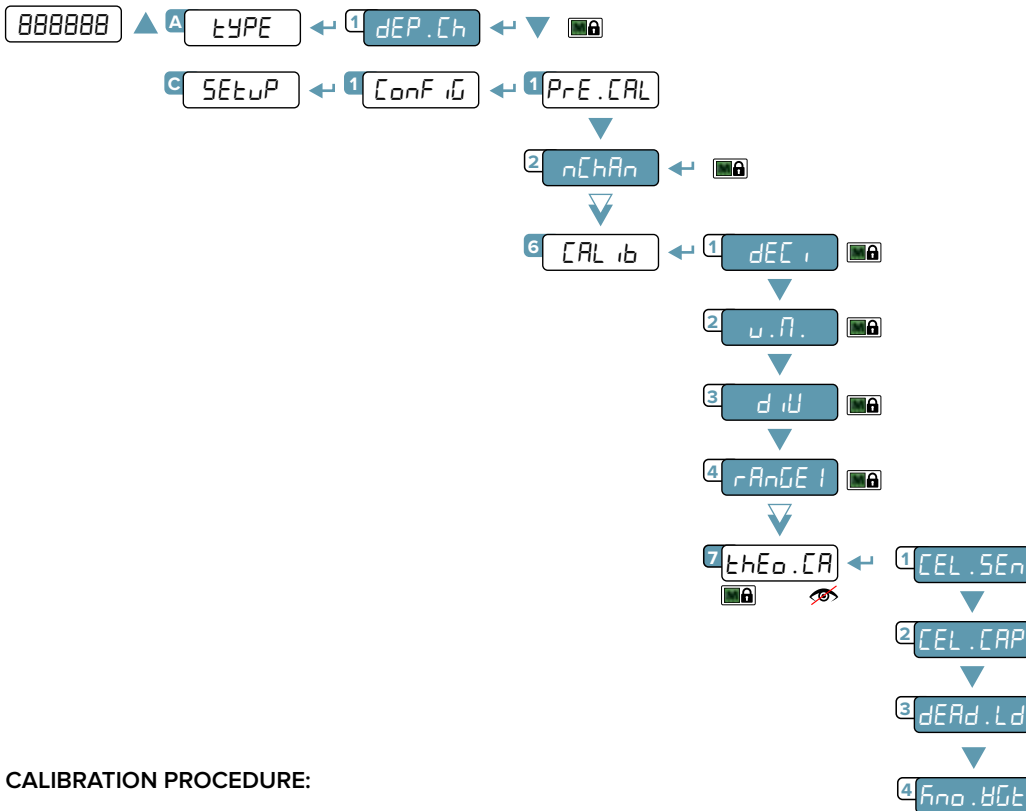

MENU ACCESS:
 Press the ▲ *key during the start-up procedure.*

SAVING THE PARAMETERS:
Press the ⊏ *key several times, until the display shows* SAUEP. *Press the* ↵ *key to confirm.*

CALIBRATION PROCEDURE:

1. Select mode of use *dEP.Ch*.

2. Set the number of connected scales (from *1* to *4*).

3. Set the calibration parameters:
- *dECi* = Number of decimals.
- *u.M.* = Unit of measurement (*KG, G, t, Lb*).
- *diU* = Minimum division.
- *rAnGE1* = Maximum range.

4. Equalise the cells.
   Attention: The equalisation procedure is not compulsory. However, for a good accuracy of the system, it is recommended to perform it.
   To perform equalisation follow the instructions on **page 33**.

5. Acquire the calibration points *(continued on next page)*

DINI ARGEO
Scales - Weighing systems

Optimized layout for A4 print

Anti-peak filter

The transmitter has an additional filter for the elimination of sudden weight peaks (e.g. shocks or falling material).
The following parameters, opportunely configured, allow you to eliminate the peak by blocking the weight for its entire duration.
The weight is blocked if it remains within the number of divisions set in $PR.LR.dU$ for the time set in $PR.LR.tN$ and is subsequently unblocked if the weight deviates from the blocking value for a number of divisions greater than $PR.d iU$ (o $PR.bn.dU$) or if the time set in $PR.t iNE$ has elapsed.
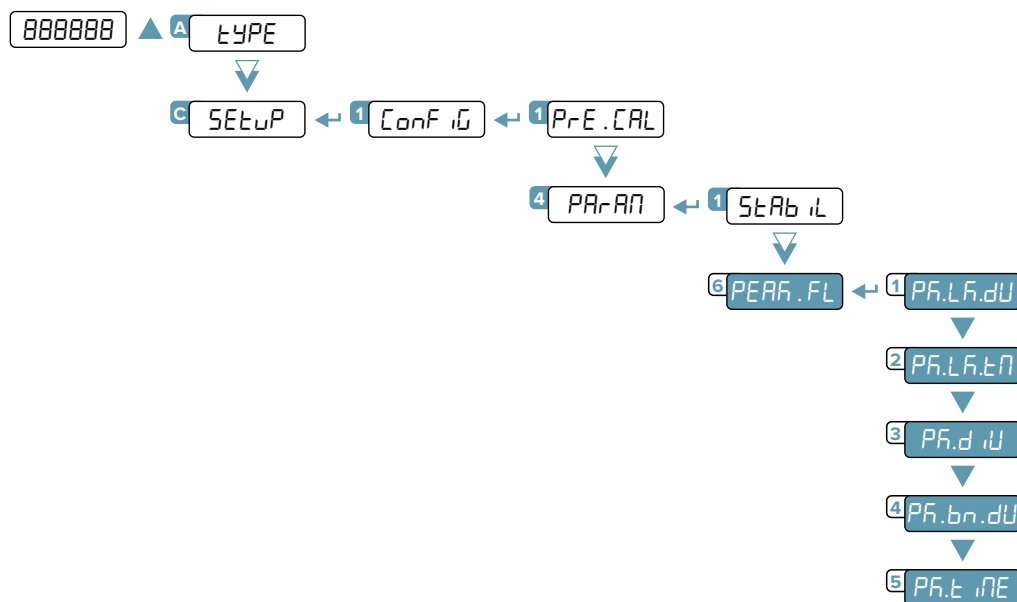

Stability detection sensitivity

It is possible to decide that tare, zero and print functions (from keypad or serial command / PLC) are performed only if the weight is stable.
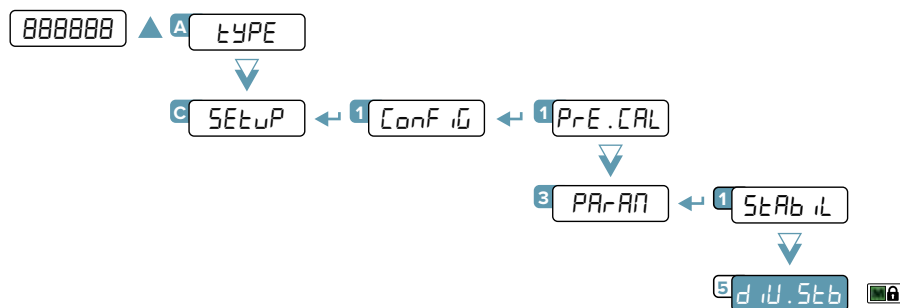

The value 0 disables the stability control.
By entering a value other than 0, you enable stability control.
Enter the number of deviation divisions beyond which the transmitter detects instability.

From 0 to 99.
⚙ = 02.
M = 02.

Scales - Weighing systems

Restoring zero

```
888888  ▲  A[ tYPE ]
                ▼
         C[ F.ModE ] ←┘ 1[ FunCt ]
                            ▽
                  5[ rS.2Ero ] ←┘ [ diSAb ] ⚙   Zero restoring disabled.
                                     ▼
                                [ EnAb ]      Zero restoring enabled.
```

• If Auto.0 = diSAb:
The last zero in the memory before turning off the power is always restored.
• If Auto.0 = EnAb / CYCLE:
The last zero in the memory before turning off the power is restored only if the auto-zeroing fails.
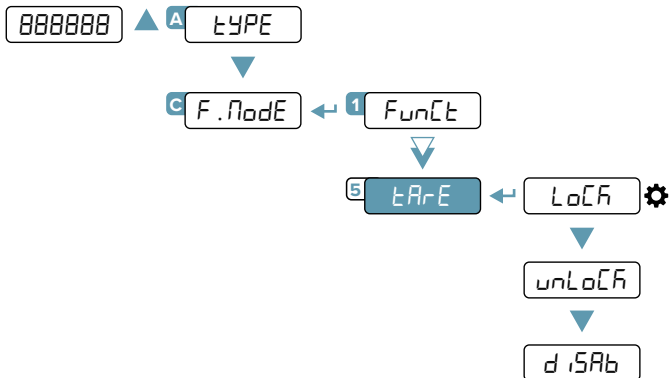

Semi-automatic zeroing

By pressing the ▼ key, or sending the zero command, the transmitter zeroes the gross weight on the scale. For a moment the display shows "2Ero" and then it shows 0 (gross weight).

The semi-automatic zeroing cannot be performed if:
• The weight on the scale is greater than the zero capacity (0.PErC).
• The weight is unstable.

Tare functions and parameters

Tare mode

```
888888  ▲  A[ tYPE ]
                ▼
         C[ F.ModE ] ←┘ 1[ FunCt ]
                            ▽
                  5[ tArE ] ←┘ [ LoCh ] ⚙   Tare blocked. When the gross weight drops to 0, the tare remains
                                            engaged.
                                ▼
                            [ unLoCh ]     Tare unlocked. When the gross weight drops to 0, the tare is cleared.
                                ▼
                            [ diSAb ]      Tare disabled.
```

Semi-automatic tare

By pressing the ▲ key, or sending the tare command, the transmitter sets as tare the weight on the scale. For a moment the display shows "tArE" and then it shows 0 (net weight). The **NET** light indicates that the net weight is shown on the display.

The semi-automatic tare cannot be performed if:
• The weight is less than one division.
• The weight is overloaded.

Optimized layout for A4 print
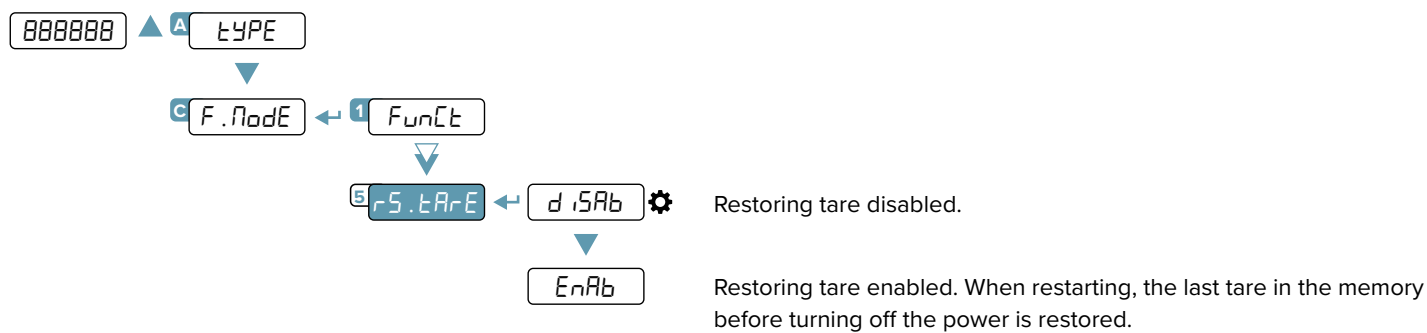

Predetermined tare

By holding down the ▲ key, or by means of the predetermined tare command, it is possible to enter a tare value manually.
For a moment the display shows "-Ɛⁿ-" and shows the tare present (or 0 if no tare is present).
Enter the tare value and press ↵ to confirm.

Clearing the tare

The tare can be cleared in different ways:
*   By unloading the scale and performing a semi-automatic tare.
*   By entering a predetermined tare value of 0.
*   If the weight is negative, pressing the ▼ key.

Restoring the tare
Restoring tare disabled.

Restoring tare enabled. When restarting, the last tare in the memory before turning off the power is restored.

MENU ACCESS:

888888 ▲   Press the ▲ key during the start-up procedure.

SAVING THE PARAMETERS:

Press the ⊏ key several times, until the display shows 5AUEⁿ. Press the ↵ key to confirm.

Alibi memory

The alibi memory allows you to store the weight values transmitted to the computer for further processing and/or data integration. The stored values can then be retrieved from the PC port or directly on the display of the transmitter for later checking.

Enabling the alibi memory

888888 ▲ **A** $\boxed{\text{ヒYPE}}$

▼
4 $\boxed{\text{ALibi}}$

Saving a weighing operation in the alibi memory

A weighing operation is stored after receiving the **PID** serial command (see **"Serial commands" page 57**) or after pressing the ↵ key. The transmitter transmits on the PC port the gross weight, the tare and an ID code that uniquely identifies the weighing. The ID has the following format:
• rewrite number: 5-digit number (from 00000 to 00255) indicating the number of complete rewrites;
• weighing number: 6-digit number (from 000000 to 131072) indicating the weighing number in the current rewrite.
Each time it is saved, the weighing number is increased by 1; when it reaches the value 131072, it starts again from 000000 and the rewrite number is increased by 1.

Example
If the weighing that has been saved is as follows:

PIDST,1,   1.000kg,   1.000kg,00126-131072

The next one will be:

PIDST,1,   1.000kg,   1.000kg,00127-000000

A weighing operation can only be saved if the weight ≥ 0, stable and valid (not underloaded or overloaded).
To store the weighing operation by key, the function must be active (see **"Reactivating printing" on page 53**).
In addition, if the transmitter is approved, the weight must exceed 20 divisions.

If these conditions are not met:
• the response to the PID command will have "NO" instead of the ID (**PIDST,1,   1.000kg,   1.000kg,NO**);
• there is no transmission when the ↵ key is pressed.

Reading the alibi memory

FROM THE TRANSMITTER (MANUAL)

By pressing the ▶ key you can read a saved weight:
you will be asked to enter the rewrite number "rEϐ . ιd" (from 0 to 255) and the ID number " ιd" (from 0 to 131072).
The weighing data are shown. Use the ▼ and ▲ keys to scroll through the following information:
* "Ch . X", where X indicates the scale number.
* "υΠ YY", where YY indicates the unit of measurement (ϐG, G, ϐ or Lϐ).
* "GroSS", followed by the gross weight.
* "ϐArE / ϐArEPϐ", followed by the tare value.
Press the ⊏ key to return to weighing.

The weighing of an ID can only be verified if:
• it has a rewrite number equal to the current alibi memory number and a weighing number ≤ the last value received with the PID command;
• it has a rewrite number ≥ 0, but 1 less than the current alibi memory value, and a weighing number greater than the last value received with the PID command.

FROM PC

To read a weighing operation from a PC, see the serial command **"READING A WEIGHING OPERATION IN THE ALIBI MEMORY"** on page 57.

FROM PLC

To read a weighing operation from a PLC, refer to the Modbus and Fieldbus protocol manuals.

> **i**
> If the alibi memory is empty, when the ▶ key is pressed the display shows "EΠPϐY" for one second and returns to weighing mode.
> If an invalid ID is entered, the display shows "no ιd" and returns to weighing mode.

High resolution

U iSS   Weight display in high resolution (x10). Press the ▶ key to activate or deactivate the function.
When the weight is displayed in high resolution, the ⊢ light is lit.
In the case of an approved transmitter, the high-resolution weight display is automatically deactivated after 5 seconds.

Peak detection

PEAH   Detection of the maximum weight value during a time interval. Press the ▶ key to activate the function. The display shows "-PEAH-" every 5 sec and the transmitter shows the maximum weight reached since the function was activated.
To deactivate the function press the ▶ again, the display shows "PEAHoF" for a moment and shows the instantaneous weight again.
By holding down the ← key it is possible to select in the P iC.Ł iП parameter the minimum time of the pulse duration, expressed in hundredths of a second. The lower this value, the higher the peak function sensitivity.

Converting units of measurement

conUEr   Converting the scale unit of measurement using a free conversion factor. Press the ▶ key to convert the weight to pounds. By holding down the ▶ key, you can enter a free conversion factor, which will be multiplied by the weight.
Example: to make the display show the cubic meters of water on the scale, enter the value 997 as the conversion factor.
The ▶ key can be used to switch from the main unit of measurement to the secondary unit at any time.
When the secondary unit of measurement is displayed, the ⊢ light is lit.

Alibi memory

SAVING THE PARAMETERS:

Press the ⊏ key several times, until the display shows
5AUEP. Press the ↵ key to confirm.

DINI ARGEO
Scales - Weighing systems

CALIBRATION PROCEDURE:

A

Connect a multimeter to the transmitter. Enter the parameter to be changed:
$Ao \ \ OU$ / $Ao \ \ \ IOU$ / $Ao \ \ \ OMA$ / $Ao.2OMA$ and set an approximate value.

Voltage output	Current output
63300 ~ 10 V	58200 ~ 20 mA
0 ~ 0 V	0 ~ 0 mA

B

Press ↵ to update the output value on the multimeter.

9.94 V

C

Increase or decrease the D/A points value to reach the desired output.

100 D/A points ~ 0.015 V - 0.035 mA
1000 D/A points ~ 0.15 V - 0.35 mA

Example:
Increase $Ao \ \ \ IOU$ from 63300 to 63550.

D

Press ↵ to update the output value on the multimeter.

9.98 V

E

Repeat the procedure from point "Ⓒ" until the desired value is reached, then press ↵ to save.

10.00 V

F

Save the changes (press the ⊏ key several times until you reach the message $SAUE?$, then press the ↵ key to confirm).

ANALOG OUTPUT GRAPHS:

Positive weight operation

Negative weight operation

ⓘ Voltage or current operation is determined by the connection to the transmitter terminals:

Current: 9 (+) and 10 (-).
Voltage: 11 (+) and 12 (-).

LEGEND:

▽ Indicates repeated pressing of the ▽ key.

Parameter visible only under certain conditions.

Parameter or menu subject to approval.

DINI ARGEO
Scales - Weighing systems

Serial communication configuration

The transmitter has 3 serial ports (COM1 / 232, COM2 / 485, USB) that can be used indiscriminately to communicate:
• In bidirectional mode with the PC / PLC ("PC" port);
• In one-directional mode with the PC, thermal printer, repeater ("PRN" port);

The USB port always allows quick connection to the PC to change / save / restore the transmitter settings at any time.

It is necessary to choose which port to use as PC and, consequently, which one to use as PRN.

Selection of the PC serial port

Use of serial port 485 as PC port (Pin 16 and 17).

Use of serial port 232 as PC port (Pin 13, 14 and 15).
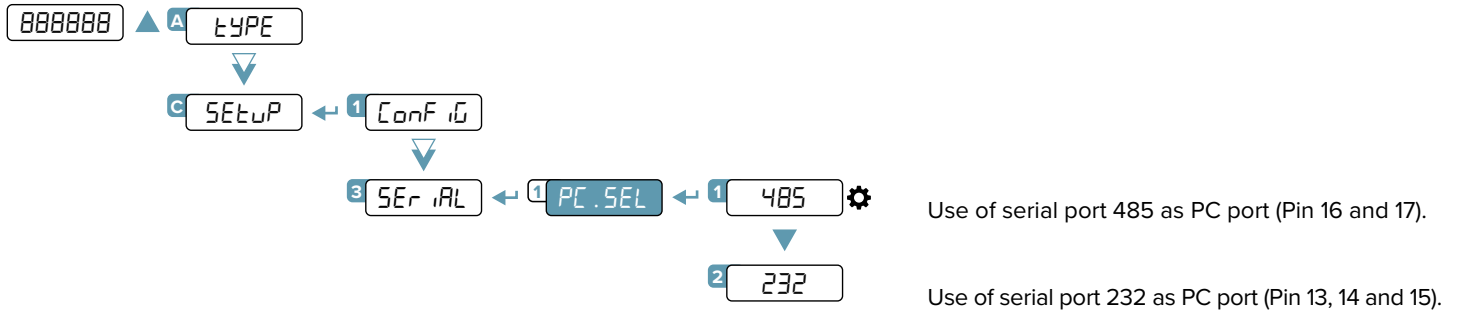

> **i** In models **DGT4XPB**, **DGT4XMODTCP**, **DGT4XETHCAT**, **DGT4XPRONET**, **DGT4XETHIP**, **DGT4XDEVNET**, **DGT4XCANOP**, port 232 is not available.

<CR LF>	Transmission terminator, characters ASCII 013 and ASCII 010

Multi-scale string

[01]ST,   612,kg,ST,   61.4, t,ST,   6.17, g,ST,   0.617,lb<CR LF>

Where:

01	Transmitter code 485 *(2 characters)*, only if communication mode 485 is enabled
ST	Scale 1 status *(2 characters)*:
	<u>US</u> - Unstable weight
	<u>ST</u> - Stable weight
	<u>VL</u> - Microvolts
	<u>RZ</u> - Converter points
,	Character ASCII 044
612	Scale 1 weight *(8 characters including the decimal point)*
,	Character ASCII 044
kg	Scale 1 unit of measurement *(2 characters)*
,	Character ASCII 044
ST	Scale 2 status *(2 characters)*:
	<u>US</u> - Unstable weight
	<u>ST</u> - Stable weight
	<u>VL</u> - Microvolts
	<u>RZ</u> - Converter points
,	Character ASCII 044
61.4	Scale 2 weight *(8 characters including the decimal point)*
,	Character ASCII 044
t	Scale 2 unit of measurement *(2 characters)*
,	Character ASCII 044
ST	Scale 3 status *(2 characters)*:
	<u>US</u> - Unstable weight
	<u>ST</u> - Stable weight
	<u>VL</u> - Microvolts
	<u>RZ</u> - Converter points
,	Character ASCII 044
6.17	Scale 3 weight *(8 characters including the decimal point)*
,	Character ASCII 044
g	Scale 3 unit of measurement *(2 characters)*
,	Character ASCII 044
ST	Scale 4 status *(2 characters)*:
	<u>US</u> - Unstable weight
	<u>ST</u> - Stable weight
	<u>VL</u> - Microvolts
	<u>RZ</u> - Converter points
,	Character ASCII 044
0.617	Scale 4 weight *(8 characters including the decimal point)*
,	Character ASCII 044
lb	Scale 4 unit of measurement *(2 characters)*
<CR LF>	Transmission terminator, characters ASCII 013 and ASCII 010

Serial commands

By selecting the PC port on demand mode (𝘰𝘯𝘥𝘌), you can communicate with the transmitter via serial commands.
For each command received, the transmitter emits a string containing the response (refer to the command description) or one of the following signals:

OK<CR LF>	Command sent when sending a correct command. This response does not imply that the command is executed.
ERR01<CR LF>	Command sent correctly but followed by letters entered unintentionally (e.g. READF, TARES).
ERR02<CR LF>	Incorrect command data.
ERR03<CR LF>	Command sent not allowed (transmitter busy, or not used in the selected operating mode).
ERR04<CR LF>	Command sent non-existent.

> *i*
>
> If the 485 protocol has been selected, you must precede the command with the transmitter address (e.g. 01READ).

WEIGHT READING (standard string)

Format	R	E	A	D	<CR LF>
Response	Standard string<CR LF>.				

WEIGHT READING IN HIGH RESOLUTION (X10)

Format	G	R	1	0	<CR LF>
Response	Standard string with weight in resolution x10 <CR LF>.				

MANUAL TARE

Format	T	M	A	N	t	t	t	t	t	t
	<CR LF>									
Where	tttttt			tare value						
Response	OK<CR LF> (or ERRxx).									

By entering a manual tare value of 0, the tare on the scale is cleared.

DISABLING KEYPAD

Format	K	E	Y	E	D	<CR LF>
Response	OK<CR LF> (or ERRxx).					

READING INPUTS

Format	I	N	P	U	n	<CR LF>
Where	n	Input (1 / 2).				
Response	I	N	P	U	n	v	v	v	v
	<CR LF>								
Where	n	Input number.			
	vvvv	Input status: 0000 = Not active. 0001 = Active. FFFF = Input reading error.			

EXTENDED OR MULTI-SCALE WEIGHT READING

Format	R	E	X	T	<CR LF>
Response	Extended string<CR LF>.				

AUTOMATIC TARE

Format	T	A	R	E	<CR LF>
Response	OK<CR LF> (or ERRxx).				

ZEROING (of active channel)

Format	Z	E	R	O	<CR LF>
Response	OK<CR LF> (or ERRxx).				

ENABLING KEYPAD

Format	K	E	Y	E	E	<CR LF>
Response	OK<CR LF> (or ERRxx).					

READING OUTPUTS

Format	O	U	T	S	n	<CR LF>
Where	n	Output (1 / 2).				
Response	O	U	T	S	n	v	v	v	v
	<CR LF>								
Where	n	Output number.			
	vvvv	Output status: 0000 = Not active. 0001 = Active. FFFF = Output reading error.

PRESSING A KEY

Format	K	E	Y	P	x	x	<CR LF>
Where	xx		Key code.				
	00		▼				
	01		▲				
	02		▶				
	03		↵				
	04		⊏				

Response	OK<CR LF> (or ERRxx).

> **i** To simulate pressing a key, you must send the KEYP and KEYR commands in succession.
> If more than 1.5 s pass after the KEYP command is sent, the transmitter will execute the function associated with prolonged pressing of the key.

RELEASING A KEY

Format	K	E	Y	R	<CR LF>
Response	OK<CR LF> (or ERRxx).				

BRIDGE BETWEEN THE SERIAL PORTS

Format	B	R	I	D	G	E	1	<CR LF>
Response	OK<CR LF> (or ERRxx).							

SCALE INFORMATION

Format	R	A	L	L	<CR LF>

Response	s	s	,	b	,	N	N	N	N	N	N	u	u	,	L	L	L	L	L	L	u	u	,
	Y	Y	T	T	T	T	T	T	u	u	,	S	S	S	,	A	A	A	,	C	C	C	C
	,	,	R	R	R	R	R	-	I	I	I	I	I	I	<CR LF>								

Where	ss	UL = Underload. OL = Overload. ST = Stable weight. US = Unstable weight.
	b	Number of the active scale.
	NNNNNNuu	Net weight with unit of measurement.
	LLLLLLuu	Gross weight with unit of measurement.
	YY	PT if a manual tare is present or " ".
	TTTTTTuu	Tare with unit of measurement.
	SSS	Scale status: 000 = scale weighing. 001 = entering a numerical value. 002 = scale in technical menu.
	AAA	Counter keys pressed: 0001 = ▼ 0002 = ▲ 0003 = ▶ 0004 = ↵ 0170 = ⊏
	CCCC	Code of last key pressed.
	RRRRR	Last rewrite number saved to Alibi memory.
	IIIIII	Last ID number saved to Alibi memory.

Where	X		Scale: 0 = scale 1 1 = scale 2 2 = scale 3 3 = scale 4				
Response	OK\<CR LF\> (or ERRxx).						

> 📖 The fieldbus protocol is described in the respective manual.

Modbus Protocol

MODBUS REGISTERS FOR DATA READING (SINGLE SCALE)

Data	Register	DESCRIPTION	
Gross Weight	30001	Gross weight value.	
	30002		
Net Weight	30003	Net weight value.	
	30004		
Input status register	30005	Bit 15(msb)	Active channel.
		Bit 14	Active channel.
		Bit 13	No function.
		Bit 12	No function.
		Bit 11	No function.
		Bit 10	No function.
		Bit 9	Input no. 2 status.
		Bit 8(lsb)	Input no. 1 status.
		Bit 7(msb)	Gross zero zone (0 = "outside zone 0"; 1 = "in zone 0").
		Bit 6	Tare PT (1 = a preset tare is active).
		Bit 5	Tare (1 = a tare is active).
		Bit 4	Overload condition (0 = No; 1 = Overload).
		Bit 3	Underload condition (0 = No; 1 = Underload).
		Bit 2	Stability (0 = Unstable; 1 = Stable).
		Bit 1	Gross weight sign (0 = "+"; 1 = "-").
		Bit 0(lsb)	Net weight sign (0 = "+"; 1 = "-").
Command status register	30006	Last command received.	
		Bit 7(msb)	Last command result.
		Bit 6	Last command result.
		Bit 5	Last command result.
		Bit 4	Last command result.
		Bit 3	Processed command count.
		Bit 2	Processed command count.
		Bit 1	Processed command count.
		Bit 0(lsb)	Processed command count.
Output status register	30007	No function.	
		Bit 7(msb)	No function.
		...	...
		Bit 2	No function.
		Bit 1	Digital output 1 status (0 = OFF; 1 = ON).
		Bit 0(lsb)	Digital output 2 status (0 = OFF; 1 = ON).
μV Channel 1	30111	μV of channel 1.	
μV Channel 2	30112	μV of channel 2.	
μV Channel 3	30113	μV of channel 3.	
μV Channel 4	30114	μV of channel 4.	

This manual contains the main registers for reading data / sending commands.
Refer to the Modbus protocol manual for a complete list of available registers.

MODBUS REGISTERS FOR DATA READING (MULTI-SCALE)

Data	Register	DESCRIPTION	
Status register scale 1	40202	Bit 15(msb) ... Bit 8(lsb)	No function.
		Bit 7(msb) Bit 6 Bit 5 Bit 4 Bit 3 Bit 2 Bit 1 Bit 0(lsb)	Preset tare (0 = "no"; 1 = "yes"). Active tare (0 = "no"; 1 = "yes"). Net weight polarity (0 = "+"; 1 = "-"). Gross zero zone (0 = "outside zone 0"; 1 = "in zone 0"). Overload condition (0 = No; 1 = overload). Underload condition (0 = No; 1 = underload). Stability (0 = "unstable"; 1 = "stable"). Gross weight sign (0 = "+"; 1 = "-").
Gross weight scale 1	40203	Gross weight of scale 1.	
	40204		
Status register scale 2	40205	As Status register scale 1.	
Gross weight scale 2	40206	Gross weight of scale 2.	
	40207		
Status register scale 3	40208	As Status register scale 1.	
Gross weight scale 3	40209	Gross weight of scale 3.	
	40210		
Status register scale 4	40211	As Status register scale 1.	
Gross weight scale 4	40212	Gross weight of scale 4.	
	40213		
Net weight scale 1	40214	Net weight of scale 1.	
	40215		
Net weight scale 2	40216	Net weight of scale 2.	
	40217		
Net weight scale 3	40218	Net weight of scale 3.	
	40219		
Net weight scale 4	40220	Net weight of scale 4.	
	40221

MODBUS REGISTERS FOR SENDING COMMANDS

Data	Register	DESCRIPTION
Command	40001	Main commands available: | Value	Command
-------	---------
00 Hex	No command
01 Hex	Zero
02 Hex	Tare
03 Hex	Predetermined tare
0A Hex	Setting setpoint 1
0B Hex	Setting setpoint 2
19 Hex	Setting digital outputs
22 Hex	Rebooting the transmitter	
Parameter 1	40002 / 40003	First command parameter. The parameter is always expressed as an absolute value (no decimal / sign).
Parameter 2	40004 / 40005	Second command parameter. The parameter is always expressed as an absolute value (no decimal / sign).

EXAMPLE 1

To reset the weight on the scale:

2. Set the command in byte 2

Byte	Value
1	00 Hex
2	01 Hex

EXAMPLE 2

To set a predetermined tare of 1000kg:

1. Set the value in parameter 1 (byte 3, 4, 5, 6)
2. Set the command in byte 2

Byte	Value
1	00 Hex
2	03 Hex
3 (MSB)	00 Hex
4	00 Hex
5	03 Hex
6 (LSB)	E8 Hex

This manual contains the main registers for reading data / sending commands.
Refer to the Modbus protocol manual for a complete list of available registers.

Scales - Weighing systems
A RICE LAKE WEIGHING SYSTEMS COMPANY

`888888` ▲ Ⓐ `tYPE`
▽
Ⓓ `d iAG`
Cells / converter test

4 `AdC .uU` — Display of the µV related to the weight on the scale.
Use the ▲ and ▼ keys to display the different channels (in `dEP.Ch` mode the sum is also visible).

For correct operation, the value of the µV of each channel must be less than 30000 with a weight equal to the maximum capacity.
This value must be stable, and increase if a load is applied to the cell.

5 `AdC.Pnt` — Display of the A/D points of the converter related to the weight on the scale.
Use the ▲ and ▼ keys to display the different channels (in `dEP.Ch` mode the sum is also visible).

For correct operation, the value of A/D points must be stable, and increase if a load is applied to the cell.

Firmware release

1 `PrG.UEr` — Display of firmware release (e.g. `08.04.00`).

Serial number

15 `SEr.nuM` — Display of transmitter serial number.

Display

8 `d iSPLA` — Activation of all display segments and indicators.

Keypad

9 `KEYb` — The code of last key pressed is shown on the display:

▼	8001
▲	8002
▶	8003
↵	8004
C	80AA

Press the same key 3 consecutive times to exit.

LEGEND:

▼ Indicates repeated pressing of the ▼ key.

👁 Parameter visible only under certain conditions.

🔒 Parameter or menu subject to approval.

⚙ Default value of the parameter.

Optimized layout for A4 print

Serial ports

10 `5Er`   Bridge between serial ports (for manufacturer's use).

CTS signal

11 `Ct5.5t.`   Checking the CTS signal of the printer (on) connected to the PRN port.

Inputs

13 `InPut5`   Checking the status of the inputs:
value 0 indicates that the input is disabled, value 1 indicates that the input is enabled.
Use the ▲ and ▼ keys to display the two inputs.

Outputs

12 `outPut`   Activation of the output shown on the display (`rEL.1` / `rEL.2`).
Use the ▲ and ▼ keys to activate the two outputs.

Analog output (mod. DGT4XAN)

14 `An.out`   Analog output test.
Use the ▲, ▼, ▶ keys to enter the D/A point value of the analog output.
Press the ↵ key to confirm and update the V / mA value of the analog output.
Unbalancing

The instrument has an active unbalance function as standard that signals if the load is unevenly distributed, compared to the stored condition.

Imbalance occurs when the load distribution percentage value on a cell deviates by at least 10% for more than 3 seconds.
It is possible to change these value with the following parameters:
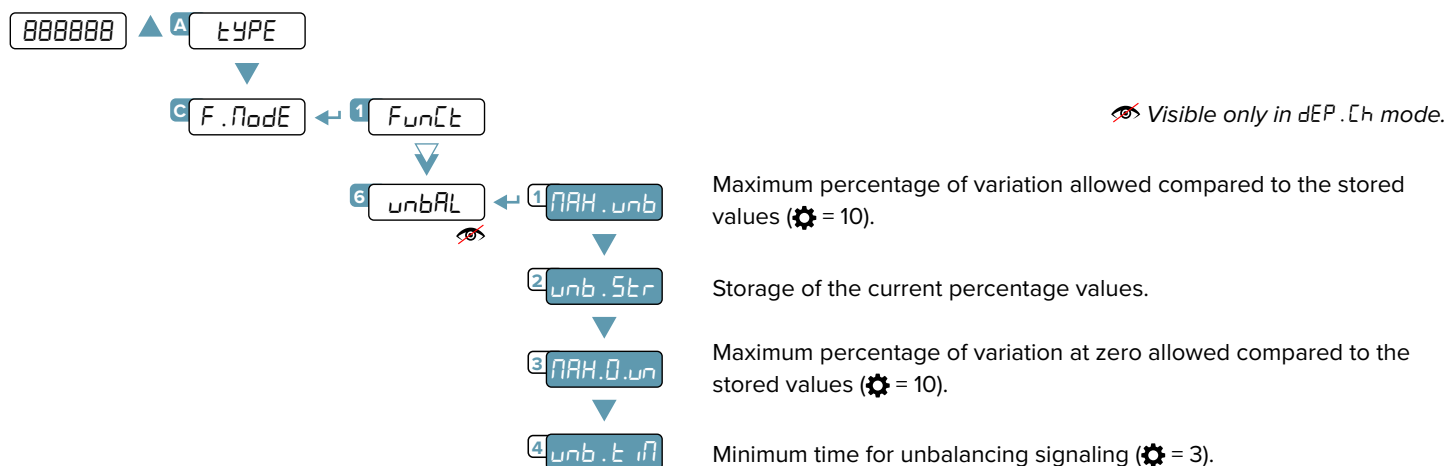

👁 *Visible only in* `dEP.Ch` *mode.*

1 `MAH.unb`   Maximum percentage of variation allowed compared to the stored values (⚙ = 10).

2 `unb.5tr`   Storage of the current percentage values.

3 `MAH.0.un`   Maximum percentage of variation at zero allowed compared to the stored values (⚙ = 10).

4 `unb.t in`   Minimum time for unbalancing signaling (⚙ = 3).

Complete menu on pages **24 - 25**

MENU ACCESS:
`888888` ▲   *Press the* ▲ *key during the start-up procedure.*

SAVING THE PARAMETERS:
*Press the* ⊏ *key several times, until the display shows* `5AUEP`. *Press the* ↵ *key to confirm.*

DINI ARGEO
Scales - Weighing systems
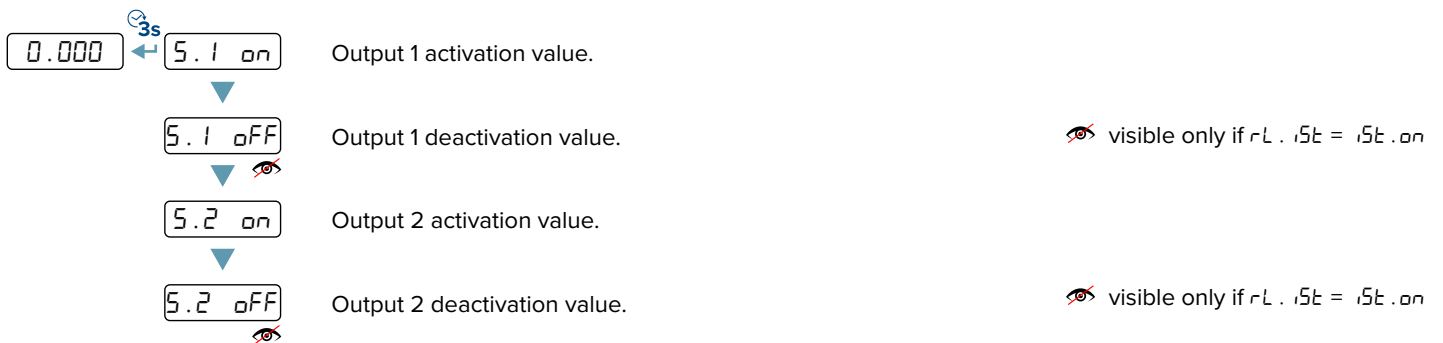

Example:

Condition stored
The unbalance condition is signalled via Modbus / Fieldbus or a digital output ($Func = 3 \, l . unb$).

> ℹ️ This function is only available if $EHEL . Eh = nonE$.
> Use this function only in systems where the load is evenly distributed.

Programming the Setpoints

In weighing mode, if the output functions ($l \; GroSS / 2 \; nEt$) have been set correctly, pressing ↵ **for 3 seconds** will enter the setpoint programming menu:

Display	Description	
0.000 → ⏱3s $5.l \; on$	Output 1 activation value.	
▼ $5.l \; oFF$	Output 1 deactivation value.	👁 visible only if $rL . l5t = l5t . on$
▼ 👁 $5.2 \; on$	Output 2 activation value.	
▼ $5.2 \; oFF$	Output 2 deactivation value.	👁 visible only if $rL . l5t = l5t . on$
▼ 👁		

Once you have entered the desired values, press ⊏. The display shows "$5torE$" and returns to weighing mode.

LEGEND:

▽ Indicates repeated pressing of the ▽ key.	👁 Parameter visible only under certain conditions.	🔒 Parameter or menu subject to approval.	⚙ Default value of the parameter.

Optimized layout for A4 print

Restoring factory settings

```

Alarms

Alarm	Description	
PrEC	Displayed if you try to calibrate a point without first confirming the number of calibration points (n EP).	
Er.Not	Calibration error: unstable weight during point acquisition.	
ErPnt	Calibration error: during the acquisition of a calibration point a NULL value was read from the converter.	
Err.H.1	Error that occurs if the capacity of channel H is not set, or there is an error in the calibration parameters of channel H, where H indicates the number of the channel to which the error refers.	
oUEr H	Error that occurs if the capacity of channel H is not set, or there is an error in the calibration parameters of channel H, where H indicates the number of the channel to which the error refers.	
Er 11	Calibration error: a sample weight that is too low was used; it is recommended to use a weight of at least half the scale's capacity.	
Er 12	Calibration error: The acquired calibration point (EP 1 / EP 2 / EP 3) is equal to the zero point (EP0).	
Er 37	Scale to be calibrated (we recommend resetting the transmitter to the factory default "dEFAu" settings before proceeding).	
Er 39	Scale to be calibrated (we recommend resetting the transmitter to the factory default "dEFAu" settings before proceeding).	
C.Er. -36	Negative internal points were calculated during calibration: • the calibration point is below the zero point; • the signal is negative (check the connections).	
C.Er. -37	Internal points below the minimum value were calculated during calibration: • the calibration point is equal to the zero point; • too high a capacity has been set with respect to the division.	
hH.Err	Hardware error: software not compatible with the installed hardware.	
AL.Err	Displayed when the alibi memory is enabled and the transmitter does not detect the presence of the card when the power is turned on. The ConU function is set automatically, but not saved in the setup environment.	
buSY	Printing in progress (printer serial port busy) or transmitter waiting to transmit a print to PC.	
unStAb	You are trying to print with an unstable weight.	
un.oUEr	You are trying to print with the weight in underload / overload.	
------	The weight is overloaded (9 divisions over the maximum capacity).	
------	The weight is underloaded.	Approved transmitter: -9 divisions.
		Non-approved transmitter: -100 divisions.
GroS.Er	You are trying to print with a non-positive gross weight (less than or equal to zero).	
nEr.Err	You are trying to print with a non-positive net weight (less than or equal to zero).	
no.0.unS	Weight not passed by net 0 or instability.	
ConU	You are trying to print while the transmitter is converting the unit of measurement.	
Err.CLA	Communication problems with the clock card of the transmitter.	
CEL.Err	Signal anomaly: check the connection of the cells.	
Er.CEL.1 ... Er.CEL.4	Signal anomaly: check the connection of the cell indicated.	

LEGEND:

▽ Indicates repeated pressing of the ▽ key.

👁 Parameter visible only under certain conditions.
