**Spill Containment Drum Caddy**

No longer are 205L drums awkward and heavy, and a recipe for spills and injuries. With the spill containment caddy these can be moved and decanted in safety, anywhere at anytime. This unit features a unique design which makes use of the lever principle to rotate a standing drum to the horizontal position, where a swivel wheel allows the whole unit to travel along the floor. The caddy doubles as a bund, with a 250 Litre capacity to contain at least one whole container, should it spill or leak.

- Curved profile allows the user to safely raise and lower the loaded caddy
- Webbing and tensioner ensures the drum is held securely in place in both horizontal and vertical positions
- Swivel castors allow the caddy to be moved in a horizontal position, reducing injury risk
- Recessed foot well allows the user to lever against the load when raising or lowering the load
- Sturdy stand props the caddy upright on uneven surfaces
