

For more complex rescue scenarios the Multi-Trauma dummy offers unique features that allow a variety of interesting rescue training options.

A variant of the General Duty dummy, the Multi-Trauma dummy has the right arm and right leg (below the knee) cleverly designed to be detachable, simulating a serious trauma or amputation injury to the victim. The removable limbs can also be partially attached using the Velcro at the end of the limbs. Partially attached in this way the limb may fall off during recovery if a thorough injury assessment is not made by the rescuer.

Additionally, to simulate a traumatic impalement injury an orifice on the left side of the torso allows a fence post, star picket or similar to penetrate through the dummy and be firmly secured to prevent casual removal; the trainees must follow the full procedure for extrication of the patient with an impalement injury. The shaped head provides the ability to fit an immobilisation collar.

Core construction and anatomical weight distribution is the same as the rugged General Duty dummy making these dummies tough enough to be buried under concrete, have steel lintels, concrete slabs, trees or motor vehicles laid upon them to present realistic scenarios for rescuers.

Supplied complete with gum boots and a webbing-reinforced polyester protective overall.

Available in 30kg, 50kg and 70kg weights.
