

Emergency Evacuation

Care homes and other health care settings which house large numbers of vulnerable people are required by law to have an emergency evacuation plan - in Australia, care homes must have an Emergency Evacuation Plan (PEEP) for every resident.

Excerpt from the 'NSW Care Home Evacuation Guide'

- **Paragraph 6.11** 'To ensure that a facility's emergency plan remains current and staff are able to implement designated roles, an emergency exercise to practice and test arrangements should be held annually'.

Speed of rescue is an important consideration. It would be relatively easy to move just one person - but if there are 5-6 beds on any given ward or fire block, could your team evacuate everyone safely?

FEATURES & BENEFITS

- SAFER training for teams - Using a manikin GREATLY REDUCES person-to-person contact.
- This lighter weight manikin gives a sufficient weight to train with but is easily transported in a vehicle if it needs to be shared among different sites.
- Manufactured from an antibacterial material which is also flame retardant.
- Supplied with pyjamas which are easily washable for improved hygiene in hospital and care home environments.
- Can also be used for basic CPR instruction.
- Soft body joints to eliminate the risk of pinch welts and bruising; common injuries when using plastic bodied manikins.
